Protein Sequence Searches - February 2005

All of the sequence databases on ABSS have recently been updated.

- permanent accession numbers. The new UniProt record may not contain the previous temporary numbers from the most recent version of UniProt. These sequences have been assigned new Please note that the curators of the UniProt database have purged some temporary accession accession number.
- extension .rup) that can no longer be found in the database, the permanent record with the new accession number can be found by searching the old accession number in the UniProt Protein If you encounter an accession number from an older search run against UniProt (results.file Archive database (UniPARC) at:

http://www.pir.uniprot.org/database/archive.shtml

If you have any questions regarding this information or your results, please contact any STIC searcher

members of the public who may encounter UniProt temporary accession When submitting sequence search results for scanning into IFW, please include a copy of this attachment to assist any future Examiners or numbers This Page Blank (uspic,

Subject:

sequence search

Hi! I'd like to request a sequence search for case 10/620,642:

- 1. the amino acid sequence of SEQ ID NO: 46
- 2. the amino acid sequence of SEQ ID NO: 61
- 3. the amino acid sequence of SEQ ID NO: 63

Thanks!

Bridget Bunner

     AAR83997 is human stem cell factor (SCF). Non-naturally occuring SCF and C-terminally truncated polypeptides stimualte growth of primitive progenitors such as haematopoletic progenitor calls, neural stem cells and primordial germ stem cells. The peptides can be used in a composition for treating leucopenia, anaemia or thrombocytopenia, for enhancing engraftment of bone marrow during transplantation or for bone marrow recovery after chemotherapy or radiation-induced bone marrow aplasia or myelosuppression. They can also be used for the treating neoplasia, nerve damage, infertility, intestinal damage or myelopoliferative disorders. Antibodies may be raised against the peptides for use in detection or neutralisation of SCF in serum. SCF may be useful for the treatment of AIDS and severe combined immunodeficiency (SCID) states alone or in combination with other factors such as IL-7. (Updated on 25-MAR-2003 to correct PF field.)

A DNA sequence (AAT29489) codes for human stem cell factor (SCF) ... (AAR95175). The full-length SCF transcript consists of 8 exons. A novel splice variant has been identified that appears to arise from the inclusion of a novel exon (see also AAT29488) between exons 3 and 4 of the gene. The resulting frameshift produces a novel SCF consisting of the first 39 amino acids of mature SCF followed by a 33-amino acid C-terminal region (AAR95174). The novel SCF is useful for ensuring correct
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                61 MDVLPSHCWISEMVVQLSDSLTDLLDKPSNISEGLSNYSIIDKLVNIVDDLVECVKENSS 120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               셤
                                                                                                                                        Amethod has been developed of making haematopoietic cells suitable for administration to a subject. The method comprises: (a) obtaining the member of the subject of the subject of the subject of the subject of the cells and (b) expanding the cells by adding to the cells a haematopoietically effective dose of a polypeptide product having at least part of the primary structural confirmation and one or more of the biological properties of naturally occurring stem cell factor (SCP). The method is useful for stimulating primitive progenitor cells including early haematopoietic progenitor cells including early haematopoietic disorders. The method is useful for treating haematopoietic disorders. The method is useful for expanding early haematopoietic progenitors in syngeneic, allogeneic or autologous bone marrow transplant. SCP is useful for chancing the efficiency of gene therapy based on transfecting haematopoietic stem cells. SCP is also useful for combating the myelosuppressive effects of anti-HIV drugs such as AZT and for enhancing haematopoietic recovery after acute blood loss and as a boost to the immune system for fighting neoplasia (cancer). The present invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention describes a method for enhancing (B) the efficiency of transfer of a polynucleotide (I) into a target mammalian cell (II) in vitro, comprising exposing (II) that expresses a stem cell factor (SCF) receptor to a biologically active SCF, its analogue or fragment, which induces cell proliferation, and introducing (I) to (II) in vitro. Exposure of SCF to (II) results in increased uptake of (I) into the cell. The method is useful for enhancing the efficiency of the transfer of a polynucleotide into a target mammalian cell in vitro. The method is useful in gene therapy techniques. Adidially to Adidias and Adidassis to AAB983390 represent sequences used in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Enhancing efficiency of transfer of polynucleotide into a target mammalian cell in vitro, involves exposing cell that expresses a stem cell factor receptor to stem cell factor, and introducing polynucleotide

                                                                                                                                                                                                                                                                                                                                                                                                                                         The present sequence represents human SCF (stem cell factor) protein encoded by SCF cDNA. The present invention relates to novel stem cell factors (AA002453-AA002460, AA002461) and the polymucleotides concoding them. SCF stimulate primitive progenitor cells including early haematopoietic progenitor cells. The invention also describes SCF haematopoietic progenitor cells. The invention also describes SCF cused in the isolation of human and rat SCF sequences. The polymucleotide cenceding SCF is useful for producing SCF and useful in gene therapy. It is useful for treating disorders involving blood cells such as myelofibrosis, metastatic carcinoma, acute leukaemia, multiple myeloma, Hodgkin's disease, lymphoma, Gaucher's disease, anaemia, congestive splenomegaly, Kala azar, sarcoidosis, military tuberculosis, disseminated fungus disease, Pulminating septicemia, malaria, vitamin B12 and folic acid deficiency, pyridoxine deficiency, and hypopigmentation disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö

The present invention provides the protein and coding sequences of mammalian stem cell factors (SCFS). These are capable of stimulating the growth of early haematopoietic progenitor cells, neural stem cells and primordial germ stem cells. The sequences are useful in the treatment of leukaemias, haematopoietic disorders, aplastic anaemia, paroxysmal nocturnal haemoglubinuria, malaria, pigmentation disorders, neurological and intestinal damage, infertility, ALDS and severe combined immunodeficiency (SCID). The present sequence is an SCF described in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel isolated non-human mammalian stem cell factor polypeptide stimulating growth of early hematopoietic progenitor cells, useful for treating aplastic anemia, lymphoma, Letterer-Siwe disease, Kala azar, sarcoidosis.
                                                                                                                                                                                                                                                                                                                                                              Human; rat; mammal; stem cell factor; SCF; cell growth stimulation; gene therapy; haematopoietic disorder; aplastic anaemia; leukaemia; neurological damage; intestinal damage; infertility; AIDS; SCID; severe combined immunodeficiency.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ;

                                                                                        180
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence represents human SCF (stem cell factor) protein encoded by SCF CDNA. The present invention relates to novel stem cell factors (AAB73561-AAB73568, AAB73571-AAB73576) and the polymucleotides encoding them. SCF stimulate primitive progenitor cells including early heamatopoietic progenitor cells. The invention also describes SCF peptides (AAB73578-AAB73597) and the oligonucleotides (AAB73592-AAB73395) used in the isolation of human and rat SCF sequences. The polymucleotide encoding SCF is useful for producing SCF and useful in gene therapy. It is useful for treating disorders involving blood cells such as myelofibrosis, metastatic carcinoma, acute leukaemia, multiple myeloma, Hodgkin's disease, lymphoma, Gaucher's disease, anaemia, congestive
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New stem cell factor polypeptides and their analogs which stimulate growth of early hematopoletic progenitors, useful for treating aplastic anemia, carcinoma, multiple myeloma, vitiligo, kala azar, Hodgkin's disease.
           Human, stem cell factor; SCF; early haematopoietic progenitor cell;
blood disorder; leukaemia; Hodgkin's disease; lymphoma; splenomegaly;
anaemia; Kala azar; septicaemia; malaria; hypopigmentation disorder.
                                                                                                                                                                                                                                                                                            Human SCF (stem cell factor) protein #2, encoded by SCF cDNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Martin FH

                   encoded by SCF CDNA. The present invention relates to novel frem cell factors (AAU02761-AAU0277), AAU02779, AAU02797) and the polynucleotides encoding them. SCF stimulate primitive progenitor cells including early haematopoietic progenitor cells. The invention also describes SCF peptides (AAU02777-AAU02794) and the oligonucleotides (AAU02777-AAU02794) and the oligonucleotides (AAU02777-AAU02794) and the oligonucleotides (AAU02777-AAU02794) and the oligonucleotides of producide encoding SCF is useful for producing SCF and useful in gene therapy. It is useful for treating disorders involving blood cells such as myelofibrosis, metastatic carcinoma, acute leukaemia, multiple myeloma, Hodgkin's disease, lymphoma, Gaucher's disease, anaemia, congestive splenomegaly, Kala azar, sarcoidosis, military tuberculosis, dispeminated fungus disease, Pulminating septicemia, malaria, vitamin B12 and folic acid deficiency, pyridoxine deficiency, and hypopigmentation disporders such as piebaldism and vitiligo

The sequence is described in an invention relating to novel stem cell factors, the polymoclectides encoding them and methods for producing the stem cell factors. The methods involve increasing the number of early haematopoietic progenitor cells in human peripheral blood by administering a haematopoietically effective human stem cell factor polypeptide. The methods are useful for the treatment of blood disorders, including myelofibrosis, myelosclerosis, osteopetrosis, metastatic carcinoma, acute leukaemia, multiple myeloma, Hodgkin's disease, carcinoma, Gaucher's disease, Niemann-Pick disease, refractory anaemia, malaria, vitamin Bl2 and folic acid deficiency, hypopigmentation disorders i.e. piebaldism and viral induced disorders, including AIDS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            120

The present invention relates to novel non-naturally-occurring stem cell factor (SCF) polypeptides having an amino acid sequence sufficiently comparative of that of naturally occurring SCF to allow possession of haematopoietic biological activity of naturally occurring SCF sequences of the invention are useful for treating leucopaenia, thrombocytopaenia, anaemia and for enhancing bone marrow recovery in treatment of radiation, engraftment of bone marrow during transplantation in mammals and chemical or chemotherapeutic induced bone marrow aplasia or myelosuppression. They are also useful for treating acquired immune deficiency in a human, nerve damage, neoplasia, infertility, myeloproliferative disorder, intestinal canage in a mammal. SCF sequences are useful for preparing biologically active polymer polypeptide adduct, for enhancing transfection of early active polymer polypeptide adduct, for enhancing transfection of early cative polymer polypeptide adduct, for enhancing transfection of early active polymer polypeptide adduct, for thancing transfection of early active polymer polypeptide adduct, for thancing transfer of a gene into a mammal. They are useful for treating myelofibrosis, myelosclerosis, osteopetrosis, metastatic carcinoma, acute leukaemia, multiple myeloma, catederer-siwe disease, lymphoma, Gaucher's disease, Niemann-Pick disease, Letterer-siwe disease, refractory erythroblastic anaemia, pigulantary splenic pancytopaenia, disseminated fungus disease, malaria, military cuberculosis, Fulminating septicaemia, pyridoxine deficiency, vitamin B12 and folic acid deficiency, Damond Blackfan anaemia, hypopigmentation disorders such as piebaldism, ALDS (acquired immune deficiency syndrome) and vitiligo. The present sequence is human SCF protein
acquired immune deficiency syndrome; malaria; military tuberculosis; pyridoxine deficiency; vitamin B12 deficiency; folic acid deficiency; Diamond Blackfan anaemia; hypopigmentation disorder; vitiligo.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel non-naturally-occurring stem cell factor polypeptide, useful treating leucopenia, thrombocytopenia, anemia and for enhancing engraftment of bone marrow during transplantation in a mammal.
                                                                                                                                                                                                                          /note= "Human mature SCF protein"

The present invention relates to novel stem cell factors (SCFB), polynucleotide sequences encoding the SCFB, and methods of producing polynucleotide sequences encoding the SCFB, and methods of producing mammals, particularly humans. The method of the invention is useful for the production of human SCF. The stem cell factors are useful to treat disorders involving blood cells e.g. metastatic carcinoma, acute leukaemia, multiple myeloma, Hodgkin's disease, lymphoma, refractory erythroblastic anaemia, miliary tuberculosis, disseminated fungus disease, malaria, and vitiligo. The present sequence represents human SCF
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  r treating

immune deficiency, neoplasia, nerve damage, osteoporosis, metastatic carcinoma, leukaemia and miliary tuberculosis. The SCF polypeptides are also used to expand haematopoietic progenitor cells for transplantation and to prepare such cells for transfection with a gene. The SCF polypeptides can be used for recombinant expression of the polypeptides and also as probes for mapping of the SCF gene, for identifying SCF-related diseases and as a marker for neighbouring genes. Antibodies raised against the polypeptides are useful in diagnosis and to remove SCF from blood. This sequence represents an SCF polypeptide of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human stem cell factor, SCF, protein #2.
```

```
The invention relates to preparing a (vertebrate) human stem cell factor (SCP) polyapetide comprising growing host cells transformed or transfected with DNA encoding a human SCP that stimulates growth of transfected with DNA encoding a human SCP that stimulates growth of transfected with DNA encoding a nutrient conditions, the DNA being operatively linked to an expression control sequence, and isolating the polyapetide produced. Also included is a recombinant host cell transfected with an expression control sequence, operatively linked to a long to retrebrate SCP polyapetide in the host cell. Disclosed as new are rat and human nuclet acids encoding SCP, SCP protein fragments. The DNA numan nuclet acids encoding SCP, SCP protein fragments. The DNA equence of cell plasmid DNA vectors, new and useful viral and human nuclet acids encoding SCP, SCP protein fragments. The DNA equence of and circular plasmid DNA vectors, new and useful viral transformed and transferred prokaryotic and enkaryotic host cells, and new and useful wariety of recombinant techniques or for generating new and useful viral cransfected prokaryotic and enkaryotic host cells, and new and useful methods for cultured growth of such host cells, and new and useful methods for cultured growth of such host cells, and new and useful methods for cultured growth of such host cells, and new and useful methods for cultured growth of such host cells, and new and useful and probes in isolating human genetic therapy in humans and other mammals, and companies and its related products. The DNA sequences are also useful as a protein synthesis, in genetic therapy in humans and other mammals, and and an accompanies are useful for treating heamatopoletic disoders, e.g., aplastic ansamia, paroxysmal nocturnal heamoglobinuria, myelocitesis, myelocitences, of disorders and disease, lymphona, congestive splences and disease, lymphona, congestive splences and disease, of disorders such as piebaldism and vitiligor. The SCF are also useful for treating neurological damage,
                                                                                                                                                                                                                                                                                                                                       Preparing a human stem cell factor (SCF) polypeptide, useful for treating hematopoietic disorders, e.g., aplastic anemia, comprises growing host cells transformed or transfected with DNA encoding a human SCF.
                                                                                                                                                                                                                                   Martin FH;
                                                                                                                                                                                                                                                                                                                                                                                                                            Claim 1; SEQ ID NO 46; 210pp; English.

Novel stem cell factor (SCF) such as non-naturally-occurring SCF or naturally occurring SCF, useful for treating leukopenia, thrombocytopenia, anemia, and enhancing engraftment of bone marrow during
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a stem cell factor (SCF) such as non-naturally-
occurring SCF having an amino acid sequence sufficiently duplicative of
that of naturally occurring SCF to allow possession of a haematopoietic
biological activity of naturally occurring stem cell factor, or naturally
occurring SCF. Also included are an isolated DNA sequence for use in
securing expression in a prokaryotic or eukaryotic host cell of non-
naturally occurring SCF, a prokaryotic or eukaryotic host cell
                                                                                                                                                                                                                                                                                       Human; stem cell factor; SCF; haematopoietic;

transformed or transfected with the DNA, a polypeptide product of the expression of the DNA in a prokaryotic or eukaryotic host cell, an isolated DNA sequence coding for provaryotic or eukaryotic host cell, an isolated DNA sequence coding for a provaryotic or eukaryotic host cell, an isolated DNA sequence coding for a provaryotic or eukaryotic host cell factor, a biologically functional plasmid or viral DNA vector cell factor, a biologically functional plasmid or viral DNA vector cell factor, a biologically functional plasmid or viral DNA vector cell factor, a biologically functional plasmid or viral DNA vector cell factor, a biologically functional plasmid or viral DNA vector cell factor, a biologically functional plasmid or viral DNA vector cell cardino acid sequence encoded by composite nucleic acid sequence of human SCF CDNA obtained from #1000 fibrosarcoma cell line (and having one or more of in vitro biological carcinoma cell line (and having one or more of in vitro biological carcinoma cell line (and having one or more of in vitro biological carcinoma cell line (and having one or more of in vitro biological carcinoma cell line (and having one or more of in vitro biological carcinoma cell vitro harmal y corcurring stem cell factor, and an antibody (Ab) specifically binding SCF. SCF is useful for treating permeters and enhancing engraftment of bome marrow transplantation in a mammal. SCF is useful enhancing bome marrow cecovery in treatment of radiation, chemical, or chemotherapeutic influence carcinoma and myelosuppression which involves treating perfective doses of SCF. SCF is useful for treating early haematopoietic progenitor cells with a gene which transfecting early haematopoietic progenitor cells with a gene to ammmal which involves culturing early haematopoietic progenitor cells with a gene of ammmal with involves culturing early haematopoietic progenitor cells with a gene of ammmal with involves culturing early haematopoietic progenitor cells with a gene of ammmal with involves culturing early hae

The present invention relates to a method (M1) for stimulating proliferation of melanocyte cells in a human. (M1) involves administering a Stem Cell Factor (SCF) protein, or its biologically active fragments that stimulates growth of melanocyte cells, and optionally a carrier, to the tsimulates growth of menancyte cells, and optionally a carrier, to the human. The SCF is covalently conjugated to a water soluble polymer corp corp of the cytokines. SCF is also able to stimulate the growth of primitive progenitors such as early hematopoidetic progenitor cells that are capable of maturing to erythroid, megakaryocyte, granulocyte, are capable of maturing to erythroid, megakaryocyte, granulocyte, crymphocyte and macrophage cells, and non-hematopoidetic stem cells that eventual stem cells and primordial germ stem cells (M1) is useful in accelerating bone marrow regeneration, and in augmenting T cell accelerating bone marrow regeneration, and in augmenting T cell accelerating bone marrow regeneration, and in augmenting T cell accelerating by a reduction in functional marrow mass due to toxic, radiant or immunological injury. (M1) is useful in treating AIDS, aplastic anemia, parcysmal nocturnal hemoglobinuria, wylofibrosis, multiple myeloma, Hodgkin's disease, lymphoma, Gaucher's disease, Niemann Prick disease, congestive splenomegaly, Kalazar, sarcoidosis, primary complexic pancytopenia, disease, lymphoma, Gaucher's disease, prindaring and vitiligo. (M1) is useful in treating infertility states, pricketinal damage resulting from irradiation or chemotherapy, and stem cell myelopachism and acute leukemia. (M1) is useful in expanding call hematopoletic progenitors in syngeneic, allogeneic or autologous bone marrow transplantation, and in enhancing the efficacy of gene constitution, and in enhancing the efficacy of gene Claim 2; SEQ ID NO 46; 212pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                            CYTOKINE 11:249-256 (1999).

-!- FUNCTION: Stimulates the proliferation of mast cells. Able to augment the proliferation of both myeloid and lymphoid hematopoietic progenitors in bone marrow culture. Mediates also cell-cell adhesion. Acts synergistically with other cytokines, probably interleukins (89 similarity).
-!- SUBCELLUIAR LOCATION: Type I membrane protein. Also exists as a secreted soluble form (89 similarity).
-!- PTM: A soluble form (89 similarity).

Seitz J.J., Schmutz S.M., Thue T.D., Buchanan F.C.;

The missense mutation in the bovine MGF gene is associated with the roan phenotype in Belgian Blue and Shorthorn cattle.";

Mamm. Genome 10.710-712(1999).

-I- FUNCTION: Stimulates the proliferation of mast cells. Able to augment the proliferation of both myeloid and lymphoid hematopoietic progenitors in bone marrow culture. Mediates also cell-cell adhesion. Acts synergistically with other cytokines, probably interleukins (By similarity).

-I- SUBINIT: Homodimer, non-covalently linked (Probable).

-I- SUBINIT: Homodimer, non-covalently linked (Probable).

-I- SUBINIT: Homodimer, non-covalently linked (Brobable).

-I- SUBCELLULAR ALCAPION: Type I membrane protein (1soforms 1 and 2): "Similarity).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                POLYMORPHISM: The roan locus is responsible for the coat coloration of Belgian Blue and Shorthorn cattle. The solid-colored and white animals are homozygotes, and the roan animals, with intermingled colored and white hairs, are heterozygous. The roan phenotype is due to the Asp-218 mutation. SIMILARITY: Belongs to the SCF family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                     MKKTQTWILTCIYLQLLLFNPLVKTEGICRNRVTNNVKDVTKLVANLPKDYMITLKYVPG

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         1 63:195-201(1990). Provide the proliferation of mast cells. Able to PUNCTION: Stimulates the proliferation of both myeloid and lymphoid hematopoietic progenitors in bone marrow culture. Mediates also cell-cell adhesion. Acts synergistically with other cytokines,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           PROTEIN SEQUENCE OF 26-39.

Submitted (Nov-2000) to the EMBL/GenBank/DDBJ databases.

-!- KUNCTION: Stimulates the proliferation of mast cells. Able to augment the proliferation of both myeloid and lymphoid hematopoidtic progenitors in bone marrow culture. Mediates also cell-cell adhesion. Acts synergistically with other cytokines, probably interleukins (By similarity).
-!- SUBUNIT: Homodimer, non-covalenty linked (Probable).
-!- SUBUNIT: Homodimer, non-covalenty linked exists as a secreted soluble form (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             in

MEDLINE=91004215; PubMed=169853; DOI=10.1016/0092-8674(90)90297-R; Williams D.E., Elsenman J., Baird A., Rauch C., van Ness K., March C.J., Park L.S., Martin U., Mochizuki D.Y., Boswell H.S., Burgess G.S., Cosman D., Lyman S.D.; Tadentification of a ligand for the c-kit proto-oncogene."; Cell 63:167-174(1990).

--- FUNCTION: Stimulates the proliferation of mast cells. Able to augment the proliferation of both myeloid and lymphoid hematopoietic progenitors in bone marrow culture. Mediates also cell-cell adhesion. Acts synergistically with other cytokines, probably interleukins.

--- SUBGINIT: Homodimer. non-covalently linked (Probable).

--- SUBCELLULAR LOCATION: Type I membrane protein (1soforms 1 and 2). Also, exists as a secreted soluble form (1soform 1 only) (By
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        1 MKKTQTWILTCIYLQLLLFNPLVKTEGICRNRVTNNVKDVTKLVANLPKDYMITLKYVPG

-!- DEVELOPMENTAL STAGE: Acts in the early stages of hematopoiesis.
-!- PTM: A soluble form is produced by proteolytic processing of isoform 1 in the extracellular domain.
-!- SIMILARITY: Belongs to the SCF family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ;

Sequence 46, Application US/08482918

Patent No. 6207417

GENERAL INPORMATION:

APPLICANT: Zeebo, Krisztina M.
APPLICANT: Suggs, Sidney V.

APPLICANT: Bosselman, Robert A.

APPLICANT: Martin, Francis H.

TITLE OF INVENTION: Stem Cell Factor

NUMBER OF SEQUENCES: 104

CORRESPONDENCE ADDRESS:

ADDRESSEE: Marshall, O'Toole, Gerstein, Murray & Borun STREET: 6300 Sears Tower, 233 South Wacker Drive CITY: Chicago

STREET: 6100 Sears Tower, 233 South Wacker Drive CITY: Chicago

STRYE: Illingis

COUNTRY: United States of America

ZIP: 60666-6402

COMPUTER: IBM FC compatible

COUNTRY: TIM FC compatible

OPERATING SYSTEM: PC-DOS/MS-DOS

SOFTWARE: PatentIn Release #1.0, Version #1.30

CURSSIFICATION NUMBER: US/08/482,918

FILING DATE: 07-UNN-1995

CITAGNEY/AGENT INPERMATION: ATTORNEY/AGENT INPERMATION

NAME: Clough, David W.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 61, Application US/08482918

Sequence 61, Application US/08482918

Patent No. 6207417

GENERAL INFORMATION:

APPLICANT: Seebo, Krisztina M.

APPLICANT: Seebo, Krisztina M.

APPLICANT: Bosselman, Robert A.

APPLICANT: Busselman, Robert A.

APPLICANT: Busselman, Robert A.

APPLICANT: Busselman, Robert A.

TITLE OF INVENTION: Francis H.

TITLE OF INVENTION: Stem Cell Factor

NUMBER OF SEQUENCES: 104

CORRESPONDENCES: Marshall, O'Toole, Gerstein, Murray & Borun

STREET: 6300 Sears Tower, 233 South Wacker Drive

CITY: Chicago

STATE: Illinois

COMPUTER READABLE FORM:

MEDIUM TYPE: Ploppy disk

COMPUTER READABLE FORM:

MEDIUM TYPE: Ploppy disk

COMPUTER: DEM PC Compatible

OPERATING SYSTEM: PC-DOS/MS-DOS

SOFTWARE: Patentin Release #1.0, Version #1.30

CURRENT APPLICATION DATA:

ATTORNEY/ACRIT INFORMATION:

NAME: Clough, David W.

REGESTRATION NUMBER: 35,010

GENERAL INFORMATION:

APPLICANT: Sugge, Sidney V.

APPLICANT: Martin, Francis H.

TITLE OF INVENTION: Method for Enhancing the Efficiency of Gene
TITLE OF INVENTION: Transfer with Stem Cell Factor (SCF) Polypeptide

NUMBER OF SEQUENCES: 104

CORRESPONDENCE ADDRESS:

ADDRESSEE: ARBHABIL, O'Toole, Gerstein, Murray & Borun
STREET: 6300 Sears Tower, 233 South Wacker Drive
